

# CLASSE

Owner's Manual  
CA-2200  
Power Amplifier

**WARNING: TO REDUCE THE RISK OF FIRE OR ELECTRIC SHOCK, DO NOT EXPOSE THIS APPLIANCE TO RAIN OR MOISTURE.**

The lightning flash with arrowhead symbol, within an equilateral triangle, is intended to alert the user to the presence of uninsulated dangerous voltage within the product's enclosure that may be of sufficient magnitude to constitute a risk of electric shock to persons.

The exclamation point within an equilateral triangle is intended to alert the user to the presence of important operating and maintenance (servicing) instructions in the literature accompanying the appliance.

Marking by the "CE" symbol (shown left) indicates compliance of this device with the EMC (Electromagnetic Compatibility) and LVD (Low Voltage Directive) standards of the European Community.

---

#### NOTICE

All of us at Classé take extreme care to ensure that your purchase will remain a prized investment. We are proud to inform you that all Classé components have been officially approved for the European Community (CE) mark.

This means that your Classé product was subjected to the most rigorous manufacturing and safety tests in the world. The CE mark certifies that your purchase meets or exceeds all European Community requirements for unit-to-unit consistency and consumer safety.

The information contained in the manual is subject to change without notice. The most current version of this manual will be posted on our web site at <http://www.classeaudio.com>.

# Important Safety Instructions

## Caution:

Please read and observe all warnings and instructions in this owner's manual and all those marked on the unit. Retain this owner's manual for future reference.

1. **Do not attempt to service this product yourself.** Do not open the cover for any reason. There are no user-serviceable parts inside. An open unit, particularly if it is still connected to an AC source, presents a potentially lethal shock hazard. Refer all questions to authorized service personnel only.
2. **To prevent fire or shock hazard, do not expose the unit to water or moisture.** If a liquid does enter your component, immediately disconnect it from the AC mains and take it to your Classé dealer for a thorough check-up.
3. **Do not place your component near any heat-producing device** such as a radiator, stove, etc., Keep it away from direct sunlight.
4. **Connect your component only to an AC source of the proper voltage.** The shipping container and the rear panel serial number tag will indicate the proper voltage. Use of any other voltage may damage the unit and void the warranty.
5. **AC cords should be routed so that they are not likely to be walked on or pinched by items placed upon or against them.** Do not stress the AC cord by stretching it to reach a plug. If damage does occur to the AC cord, take it to your Classé dealer for a thorough check-up and proper repair or replacement.
6. **If your component will be out of use for an extended period of time** (vacation, etc. ), you may wish to unplug the power cord from the AC source to prevent any chance of problems from a voltage surge or lightning strike.
7. **NEVER** wet the inside of this product with any liquid.
8. **NEVER** pour or spill liquids directly onto this unit.
9. **NEVER** block air flow through ventilation slots or heatsinks.
10. **NEVER** bypass any fuse.
11. **NEVER** replace any fuse with a value or type other than that specified.
12. **NEVER** attempt to repair this product. If a problem occurs, contact your Classé dealer.
13. **NEVER** expose this product to extremely high or low temperatures.
14. **NEVER** operate this product in an explosive atmosphere.
15. **ALWAYS** unplug sensitive electronic equipment during lightning storms.

Please record the serial number of your new Classé component here for future **reference**.

# Welcome to the Classé family

Congratulations on your purchase of a Classé product. It is the result of many years of continuous refinement, and we are sure that you will enjoy it for many years to come.

We value our relationship with our customers. Please allow us to stay in touch with you by returning your warranty card now, before you pack up the shipping carton of your new product and forget all about it. Doing so will enable us to let you know about any possible future upgrades or updates that might become available for your Classé component.

Sending in your warranty card also registers your product with us so that warranty service can be obtained easily and quickly, even if you have mislaid your original sales slip.

---

**Please, take a few minutes to fill out the warranty registration card, and drop it in the mail.**

---

You will find the warranty registration card at the end of the separate warranty policy booklet, enclosed.

## a word about installation

Every effort has been made to make the Classé CA-2200 simple and straightforward to install and use.

Still, we have no way to evaluate many other variables such as the size and shape of your room, its acoustics, and the associated equipment you have chosen to use with your amplifier. All of these factors influence the ultimate performance of your system.

---

**For this reason, we strongly encourage you to have your system installed and calibrated by your dealer, whose experience, training, and specialized equipment can make a profound difference in the final performance of the system.**

---

# Unpacking and Placement

## unpacking your amplifier

Carefully unpack your power amplifier according to the supplied instructions, and remove all accessories from the carton. Please take care when lifting the amplifier, as it is quite heavy.

### Important!

---

**Keep all packing materials for future transport of your Classé product. Shipping your new component in anything other than its purpose-designed packing material may result in damage that is not covered by the warranty.**

---

## placement

There are two options when placing your power amplifier: you may place it close to the speakers, requiring longer interconnecting cables from the preamplifier; or place it close to the preamplifier, requiring longer speaker cables.

Although either approach will yield excellent performance, you might consider the first option for two reasons. First, signal quality degrades more easily when transmitted as a combination of both high voltage and high current, suggesting that speaker cables should be kept as short as practical. Second, high quality amplifiers use massive power supplies which inevitably radiate some degree of magnetic fields. Ideally, one would separate these fields from sensitive source components by a reasonable distance.

If it is more convenient for you to place the amplifier in an equipment rack, along with your other components, we suggest placing it at the bottom of the rack, well away from your source components and preamplifier. This location will also be more stable than placing such a heavy component near the top of a rack, which might make it top-heavy.

*Note that adequate clearance for the AC cord and connecting cables must be left behind the CA-2200. We suggest leaving eight inches (20 cm) of free space behind your power amplifier to allow all cables sufficient room to bend without crimping or undue strain.*

## ventilation

Your Classé power amplifier generates a certain amount of heat in the course of normal operation. Be sure to allow six inches of clearance above it and three inches to each side to allow heat dissipation through air circulation. The vents on both the bottom and the top of the CA-2200 must be kept free from any obstruction which would reduce the flow of air through the unit. Avoid placement on soft surfaces that would restrict airflow (such as plush carpeting).

### custom installations

Drawings are included in this manual to facilitate special installations and custom cabinetry (see the section *Dimensions*). An optional, purpose-designed rack mount kit is available for this product. Contact your Classé dealer for more information.

### serial number

The serial number for your power amplifier is found on the rear of the unit. Please note and record this number on the page entitled *Important Safety Instructions* for your future reference.

### register your purchase!

Having found the serial number, now would be a good time to fill out the registration card. Please register your purchase so we can advise you of updates and other items of interest.

It will take only a minute or so. Please complete the card now, before you forget.

### operating voltage

The CA-2200 power amplifier is set at the factory (internally) for 100V, 120V, 230V, or 240V AC mains operation, as appropriate for the country in which it is to be sold (*230V only in European Union countries, in compliance with CE regulations*). The voltage setting may not be changed by the user or dealer.

Make sure that the label on the rear panel of your power amplifier indicates the correct AC operating voltage for your location. Attempting to operate your power amplifier at an incorrect voltage may damage the unit.

### Warning:

---

**The voltage setting of your power amplifier may not be changed by the user. There are no user-serviceable parts within the unit. Please refer any problems to an authorized Classé service center.**

---

If the AC mains voltage indicated on your power amplifier is incorrect, please contact your local, authorized Classé dealer or distributor.

The CA-2200 can easily be powered by a normal 15-ampere AC mains line. If other devices are also powered from the same AC line, their additional power consumption should be taken into account.

The CA-2200 includes protection circuitry that will prevent the amplifier from operating at dangerously high or low voltages.

- **At startup:** the AC mains voltage must be within a range of approximately -15% to +10% of its nominal value at startup, or the amplifier will not turn on. For example, a 120V unit requires the AC mains to be between approximately 95V–135V in order to turn on.
- **Over-voltage during operation:** if the AC mains voltage surges by roughly 10% or more during operation, the amplifier will enter protection mode and shut down. The **Standby LED** will flash to indicate the protection mode has been engaged.
- **Under-voltage during operation:** if the AC mains voltage sags by 15% or more, the amplifier will continue to play (since this does not present a particular danger to the amplifier), but note that it may not be able to achieve its usual standard of performance under these compromised conditions. The **Standby LED** will flash to indicate the condition.

#### warm up/break-in period

Your new Classé power amplifier will deliver outstanding performance immediately. However, you should expect to hear it improve somewhat as it reaches its normal operating temperatures and its various components “break-in.” It has been our experience that the greatest changes occur within the first 300 hours, as the amplifier reaches thermal equilibrium and the capacitors fully form. After this initial break-in period, the performance of your new product should remain quite consistent for years to come.

The only exception to this rule is if the unit is placed in *standby* or unplugged for an extended period of time, allowing it to cool down. Depending on the degree of cooling involved, you should expect a brief warm-up period before the power amplifier’s sound quality is at its best. Unless your amplifier was allowed to become quite chilled, subsequent thermal re-stabilization should not take long. Fortunately, you should never have to repeat the initial 300 hour break-in period.

#### please read this manual...

Please take a few minutes to review this manual, and to familiarize yourself with your new amplifier. We understand that you are anxious to plug everything in and get started. However, reading this manual and following the advice it gives will ensure that you get all the benefits you deserve from having purchased such a fine piece of equipment.

# Special Design Features

## highly refined circuit design

All Classé analog amplification stages are based on circuits that have been extensively optimized over many years of continuous development.

By starting with excellent circuit designs and working with them over the years, we are able to discover the many small refinements that add up to superlative performance, in a variety of applications. Altering a voltage here, or using a slightly different part there, may make all the difference between solid and absolutely outstanding performance.

This level of refinement only comes with a great deal of experience, and is not available to those who flit from one trendy notion to the next. It accounts in no small measure for both the consistency of sonic performance among Classé products (as they are all based on similar analog gain stages), and for the consistently excellent reviews those products receive by owners and reviewers alike.

## extensive listening tests

Excellent measured performance is to be expected in world-class products, and Classé products deliver that performance. However, experience has shown that technical excellence alone is insufficient to guarantee subjectively musical results.

For this reason, all Classé products are laboriously fine-tuned during the development process by carefully controlled listening tests. Our ears are still some of the finest laboratory test instruments available, and nicely complement more traditional engineering test equipment. In the course of optimizing the circuitry for a product, hundreds of decisions are made based on the subjective impression given by substituting one high quality part for another.

As an example, we may listen to half a dozen 0.1% film resistors of the same value, from several different companies. Standard tests may show them all to provide identical results in terms of noise, distortion, and so forth. Yet, almost invariably, one selection yields some small improvement in the subjective reaction to the performance of the product under development. Less often, even a single such change can result in a surprisingly large improvement.

Multiply those various improvements by the dozens or even hundreds of such decisions that must be made before the product can be finalized for production, and you have a remarkable improvement, indeed—all based on careful listening tests, which we view as a necessary complement to the solid engineering you might rightly expect from Classé.

## extraordinary longevity

Another benefit of having worked with highly refined circuit designs so extensively over many years is that we have vast experience in what works well over the long term.

By using only the highest quality parts to begin with, and then using them in an informed way as a result of both accelerated aging experiments and actual long-term experience, we are able to design and manufacture products which we are confident will stand the test of time.

We are confident that your new Classé product will give you many years of trouble-free reliability and musical enjoyment, just as previous Classé products have given their owners.

## robust protection

Finally, your new Classé amplifier incorporates a variety of protection circuits, all designed to protect both the amplifier and your loudspeakers against dangerous fault conditions. Significantly, these protection circuits do not intrude upon or limit the normal performance of the amplifier; rather, they simply put the amplifier into *protection* mode when confronted with abnormal conditions. These conditions include:

- output overload
- DC offset
- AC mains voltage (outside of normal tolerances)
- excessive operating temperatures

If any of the first three conditions occurs on either channel (*any of which might harm either your amplifier or possibly your loudspeakers*), the amplifier will immediately go into protection mode. In such a case, a **Channel LED** indicator will blink red, indicating the channel with the fault, and the sound will be muted until the fault can be righted.

If the fault is not channel-related, e.g. AC mains voltage out of range, the **Standby LED** will blink. In all cases, the unit will need to be re-started once the cause of the fault condition has been rectified.

## Front Panel

### 1 Standby button & LED indicator

The front panel **Standby** button will toggle the amplifier between *operate*, its fully operational state, and a *standby* mode that leaves the amplifier off, yet ready to respond to system commands via any of the supported control options (e.g. IR input, DC trigger, CAN Bus, or RS-232).

The current state of the amplifier is indicated by the **LED** indicator in the center of the **Standby** button. The state of this **LED** indicates the following:

- on = *standby*
- flashing (on power-up) = *initialization*
- off + **Channel LED** on = *operate*
- flashing (after power-up) = *AC mains voltage out of range*

When in *standby*, the amplifier's gain stages are powered down. Only a small power supply and control circuit remain on, consuming relatively little power. Fortunately, since the output stages by their nature conduct a great deal of current, they warm up and sound their best very quickly.

If you are not going to use the amplifier for an extended period of time, perhaps while traveling for a vacation, we suggest you disconnect it from the AC mains. Please be certain that the amplifier is in *standby* prior to disconnecting it from the AC mains.

Also, it is a good practice to physically disconnect any and all valuable electronics from the AC mains during electrical storms, as a lightning strike anywhere near your home can put a tremendous surge on the AC mains that can easily damage any piece of electronics, no matter how well designed and protected. The best protection in the case of severe electrical storms is to simply remove the electronics from any connection with the power grid.

## 2 **Select button**

The **Select** button is used (along with the **Mode** button) when configuring the amplifier for either balanced or single-ended operation. It is also used when configuring the turn-on delay or amplifier number for an amplifier connected to a Classé preamplifier by the DC Trigger or CAN Bus control systems.

## 3 **Channel status LED indicators**

Each amplifier channel has two **Channel LED** indicators. They are used to indicate the use of either balanced (XLR) or single-ended (RCA) inputs for that channel.

These indicators are also used to indicate fault conditions in your amplifier, should any ever arise. If a channel's LED indicators blink red, there is a problem in that particular channel. If all the **Channel LEDs** are blinking red, there may be a systemic problem that is not specific to a particular channel.

**Caution!**

---

**If you see any Channel LED Indicator blinking red, please disconnect the amplifier from the AC mains immediately and check that all external connections are cleanly made and secure. If no fault is immediately obvious, please call your authorized Classé dealer for assistance.**

---

## 4 **Mode button**

The **Mode** button is used (along with the **Select** button) when configuring the amplifier for either balanced or single-ended operation. It is also used when configuring the turn-on delay and amplifier number of the amplifier when it is connected to a Classé preamplifier by the CAN Bus communications or Trigger systems.

## Rear Panel

The following descriptions are intended as a quick reference, should you have any questions about your new product. Please see the next section (entitled *Initial Setup*) for specific advice on incorporating your new amplifier into your system.

### 1 Balanced (XLR) Input

Balanced audio interconnections were originally developed in the professional audio world, for preserving the delicate nuances of extremely small microphone-level signals. For many years now, they have also been used by performance-oriented consumer companies like Classé to preserve every nuance of the finest audio performances in your collection.

Technically, balanced audio interconnections provide two distinct benefits: they double the signal's strength as it travels from one component to the next, increasing the potential signal to noise ratio by 6 dB; they also do an excellent job of rejecting noise and interference that might otherwise be picked up between the components, due to either EMI (electromagnetic interference) or RFI (radio frequency interference). In the world of wireless telecommunications, there is more potential interference around than ever before—it makes sense to keep it out of music and movie soundtracks.

For this reason, we strongly recommend using the balanced analog interconnections between your Classé components wherever possible.

The pin assignments of these **XLR input connectors** are:

- Pin 1: Signal ground
- Pin 2: Signal + (non-inverting)
- Pin 3: Signal – (inverting)
- Connector ground lug: chassis ground

These pin assignments are consistent with the standard adopted by the Audio Engineering Society (AES14-1992).

If you are using your Classé power amplifier with a Classé preamplifier, you're all set – just take standard balanced interconnect cables and plug them in. Then engage that input on the power amplifier by configuring it as described in *Initial Setup*.

If you are using another brand of preamplifier, please refer to the operating manual of your balanced-output preamplifier to verify that the pin assignments of its output connectors correspond to your amplifier. If not, have your dealer wire the cables so that the appropriate output pin connects to the equivalent input pin.

## 2 Single-Ended (RCA) Input

Single-ended cables using **RCA** connectors are the most common form of analog connection used in consumer electronics. When implemented carefully and with use of high quality interconnecting cables, this standard can provide excellent performance. Classé has gone to extraordinary effort to ensure that the single-ended (RCA) inputs of your power amplifier are as good as possible. However, this connection standard cannot offer the immunity from interference that balanced interconnection does—hence our recommendation to use the balanced inputs when possible.

If you elect to use the single-ended inputs of your Classé power amplifier, you need to engage them by configuring the amplifier as described in *Initial Setup*.

## 3 Speaker Outputs

Two pairs of high quality **five-way binding posts** are provided on the amplifier, in order to facilitate “bi-wiring.”

In practice, bi-wiring involves connecting two (preferably identical) sets of speaker cables between each amplifier channel and its corresponding loudspeaker. In many cases, the benefit is a subjectively improved level of clarity and detail from the speaker, as a result of being able to feed the two separate sections of its crossover and driver complement with identical, yet separate signals.

*(Many high quality loudspeakers also offer two sets of connections on their speakers. Generally, one set of the connections on the loudspeaker feeds the portion of the speaker's crossover network that supplies the woofer with its signal; the other set of connections connects to the portion of the crossover that supplies the rest of the speaker with the midrange and high frequencies.)*

Although the binding posts on your Classé amplifier will accept bare wire connections, we strongly recommend the use of high quality spade or hook lugs, crimped and soldered onto the ends of your speaker wires. Using high quality connectors will ensure that your speaker connections do not gradually deteriorate from fraying and oxidizing bare wires. It also helps prevent accidental short-circuits from poorly-terminated connections.

#### 4 Classé CAN Bus Control Ports

These **RJ-45** connectors are reserved for future control and communication applications using Classé Audio's implementation of the Controller Area Network (CAN) Bus specification.

#### 5 IR Input and Output

Your Classé amplifier includes two  $\frac{1}{8}$ <sup>th</sup>-inch **mini mono-jacks** in order to support the IR remote controls that are ubiquitous today. IR commands exist for toggling the amplifier between *operate* and *standby*, as well as discrete command codes for either *operate* or *standby*. These codes may be used in "macros" for sophisticated remote control systems, facilitating the control of the amplifier in the larger context of a complete system.

Actually, this *IR Input and Output* description is a bit of a misnomer: the input supplied to these plugs is *electrical* in nature, not IR. It is obtained by using standard IR receivers, distribution amplifiers, and emitters (available from your dealer) to translate the remote's flashes of infrared light into corresponding pulses of electricity. The big advantages here include being able to easily route the signals anywhere they might need to go, and the reliability of a solid electrical connection.

Since an IR distribution system such as your dealer may design for you usually must control many products, your amplifier includes both an IR input (for the control of this product) and an IR output (so as to pass along the same signal to the next product). This allows you to "daisy chain" your control wires from one product to the next.

The amplifier is designed to respond to IR commands of 5 Volts DC, with the tip of the mini mono-plugs defined to be "positive" relative to the shank of the plug.

## 6 DC Trigger Input and Output

Many audio/video preamplifiers can supply a DC control voltage to associated equipment in order to induce desired behavior. Your Classé amplifier can take advantage of these capabilities in order to be switched between *operate* and *standby* automatically, perhaps in concert with the A/V preamp itself.

Two 1/8<sup>th</sup>-inch **mini mono-jacks** provide this remote-controlled turn-on (that is, toggling between *operate* and *standby*) of the amplifier. These jacks provide a simple pass-through of the control voltage from one to the other, allowing you to “daisy-chain” a series of amplifiers quite easily.

The remote trigger will be operated by the presence of 5–12 Volts DC, with tip polarity as shown below:

## 7 RS-232 Control Port

This **DB-9 connector** has **two purposes**:

- downloading new operating software into your amplifier (should new features ever be added, for example)
- for external control of your amplifier by systems such as i-Command™, AMX® and Crestron™

For more information, please contact your dealer and ask about home automation systems.

## 8 AC Mains Input

An IEC standard power cord is used with the CA-2200. Plug the cord into the **IEC receptacle** on the rear panel, and the other end into a suitable wall outlet.

## 9 AC Mains Fuse

Your Classé power amplifier has an **AC mains fuse**, accessible on the rear panel. If you suspect that your AC fuse has blown, disconnect your amplifier from the AC mains, as well as from its input connections and speaker connections, and refer to the appropriate item of the section entitled *Troubleshooting*.

**Do not open your amplifier. There are no user-serviceable parts within this product.**

**Danger!**

---

Potentially dangerous voltages and current capabilities exist within your power amplifier, even when disconnected from AC mains. Do not attempt to open any portion of the amplifier's cabinet. There are no user-serviceable parts inside your power amplifier. All service of this product must be referred to a qualified Classé dealer or distributor.

---

# Initial Setup

Your new Classé amplifier is quite simple to set up and enjoy. Please follow the steps outlined below in order to safely set up and use your new amplifier.

## Important:

The AC mains connection should be the last connection you make on your new power amplifier. In addition, it is always a good idea to power up your power amplifier(s) last, after everything else has been powered up and has stabilized.

Conversely, it is good practice to power the amplifier(s) down first when shutting down the system, as this prevents any transients from other components from getting through to your loudspeakers.

1. **Unpack everything according to the included instructions.**  
Be careful when doing so, as this amplifier is quite heavy.
2. **Place your amplifier (be sure to read “Unpacking and Placement”) and connect it to the AC mains.**  
This includes deciding on the location, making sure you have adequate ventilation, and adequate clearance for all the wires behind the amplifier. Once accomplished, connect the amplifier directly to the AC mains. Do not use extension cords, as most are not suitable for the current sometimes required by your amplifier.
3. **Configure your amplifier.**  
The **Select** and **Mode** buttons are used when configuring your amplifier for how you would like it to operate.

*configuring balanced/  
single-ended operation*

While in *standby*, pressing the **Select** button will cause the **Channel LEDs** to light up, indicating how the amplifier is currently configured (either balanced or single-ended) for each channel.

One of the **Channel LED** indicators will be blinking, indicating that you may select either balanced or single-ended operation for that channel. Press the **Mode** button to toggle between either the balanced mode or the single-ended mode of operation, as indicated by which of the two channel LEDs for that channel is blinking.

Press the **Select** button again to select the other channel, and press the **Mode** button to select the configuration for that channel.

To finish, press and release the **Select** button until both **Channel LEDs** are off.

Make sure you configure the amplifier to use the type of input connection you will be using.

In a system that contains multiple Classé amplifiers, you may set the number of seconds of turn-on delay for each amplifier, allowing each to turn on in the order you have specified, rather than all at once. *This number also acts as an ID when using the CAN Bus. (Having several powerful amplifiers all turning on at the same time can sometimes stress the AC mains in your home, potentially leading to nuisance tripping of circuit breakers).*

For example, to set the delay for two seconds (and to designate a particular amplifier as #2):

- Place the amplifier in *standby* (**Standby LED** on)
- Press and hold the **Mode** button until both **Channel LEDs** are lit. When released, both LEDs will blink to indicate the turn-on delay and current number of the amplifier (e.g. once to indicate a one second delay and amplifier #1).
- If you want to change the current amplifier number setting, press and hold the **Mode** button again until both **Channel LEDs** are on.
- While continuing to hold the **Mode** button, press the **Select** button two times (the same number as the desired delay in seconds and the amplifier number);
- Release the **Mode** button. The amplifier will confirm your choice by blinking the **Channel LEDs** twice.

#### 4. Make your preamp connections.

With the amplifier in *standby* (or disconnected from the AC mains), and using high quality interconnecting cables, make the appropriate connections with the balanced or single-ended connectors (as configured in *Step 3*).

Make sure all the connections are snug, even if it means gently squeezing the outer shell of the RCA with pliers and reinserting it to tighten the connection.

#### 5. Make your speaker connections.

Make the connection between the output terminals of the amplifier and your loudspeakers, using high quality speaker wires.

Connect the black (–) terminals on the amplifier to the black (–) terminals on your speaker, and the red (+) terminals on the amplifier to the red (+) terminals on your speaker.

If bi-wiring, run a total of four conductors between each amplifier channel and its corresponding loudspeaker: two separate +/– leads, one for the bass and the other for the mids and treble. Make sure that no wires cross between the red (+) and black (–) terminals, at either end.

Make sure all the connections are snug and cannot be easily wiggled free, but do not overtighten them. If you can give the speaker wires a reasonable tug without movement, they are snug. Further tightening will not make a better connection, and (taken to the extreme) may damage the connectors.

**6. Double-check all your connections.**

We understand that this step sounds redundant, but it is worth the extra minute or two it might take just to ensure that all connections are correct and secure before plugging the power cables to the AC outlets..

**7. Turn on all the other components in your system, and then turn on your amplifier.**

It is always good practice to turn any power amplifier on last, and to turn it off first. Doing so prevents any turn-on/turn-off transients that might originate in other components from damaging your loudspeakers.

## Care and Maintenance

To remove dust from the cabinet of your amplifier, use a feather duster or a lint-free soft cloth. To remove dirt and fingerprints, we recommend isopropyl alcohol and a soft cloth. Dampen the cloth with alcohol first and then lightly clean the surface of the amplifier with the cloth. Do not use excessive amounts of alcohol that might drip off the cloth and into the amplifier.

**Caution!**

---

**At no time should liquid cleaners be applied directly to the amplifier, as direct application of liquids may result in damage to electronic components within the unit.**

---

# Troubleshooting

In general, you should refer any service problems to your Classé dealer. Before contacting your dealer, however, please check to see if the problem is listed here.

## 1. No sound, and no Channel LED is lit.

- The amplifier is not plugged into the AC mains, or the AC mains are down (circuit breaker, fuse).
- A brown-out or short-term loss of power might require the internal microprocessor to be reset. Unplug the unit for at least 30 seconds and then plug it in again and try powering it up.
- The AC mains fuse is blown. See *Troubleshooting #4*, below (or contact your Classé dealer).
- The AC mains is out of range. Check the voltage specified on the rear panel.

## 2. No sound, and one or more Channel LEDs is blinking red.

- Your protection circuitry may have been engaged. Disconnect the amplifier from the AC mains, and disconnect all inputs and outputs.
- Then try to power up the amplifier again, connecting it only to AC power. If the LED continues to blink, there is a fault condition in the amplifier itself, and it should be disconnected and taken to your Classé dealer for service.
- If it powers up without any difficulty, power it back down and reconnect only the inputs. Then restart the amplifier. If it goes into its blinking protection mode, something is wrong with a component “upstream” of the amplifier—probably a DC offset or similar problem. Your amplifier is trying to protect your loudspeakers (even small amounts of DC can damage woofers in relatively little time). Try different source components to discover whether the problem is limited to a single source, or exists all the time (which would indicate a problem with the preamplifier). Contact your dealer for help with the appropriate component.

## 3. The amplifier keeps shutting off.

- Make sure you are providing adequate ventilation to the amplifier, and that the ambient room temperature is below 105°F (40°C).
- Run through the troubleshooting sequence outlined above (assuming the amplifier is going into its protection mode).

#### 4. The AC mains fuse is blown.

There is a specific troubleshooting procedure for a blown AC mains fuse, since this rare occurrence sometimes indicates a significant problem. Please follow the following steps, in order:

- a. Disconnect your amplifier from the AC mains, as well as from its input connections and speaker connections, and remove the fuse cover on the rear of the unit.
- b. If the fuse appears to be blown, replace it only with a fuse of the same type and rating (specified below). *Using any other type of fuse, particularly a larger-value fuse, can result in permanent damage to your amplifier.* If you are uncomfortable replacing the fuse yourself, contact your Classé dealer for assistance.

Mains voltage:	100/120VAC
Fuse type:	MDA slow-blow
Rating:	10A

Mains voltage:	230/240VAC
Fuse type:	MDL slow-blow
Rating:	8A

- c. After replacing the fuse and fuse cover, reconnect the amplifier to the AC mains only and turn it on *without reconnecting either the inputs or the speaker wires*. If the fuse blows again, disconnect it from the AC mains and contact your Classé dealer for assistance.
- d. If everything seems fine, place the amplifier back into *standby* and carefully reconnect the input cable and power the amplifier up. If the fuse then blows (or the amplifier goes into protection), you may have a serious fault with your preamplifier/processor. Contact your Classé dealer.
- e. Finally, if everything is still fine, place the amplifier in *standby* and carefully reconnect the speaker wires. Check *both* ends of the speaker wires for possible short circuits. Then power up the amplifier again. If the amplifier remains functional (the fuse does not blow), then the original fuse probably blew in order to protect the amplifier from a large AC mains surge. If it blows again, contact your Classé dealer for assistance.

#### 5. The Standby LED is flashing quickly, and a Channel LED is flashing red.

- Try resetting the unit by disconnecting it from the AC mains power, waiting a few seconds, and reconnecting the amplifier to power. If this does not solve the problem, contact your Classé dealer for assistance.

# Specifications

Classé Audio reserves the right to make improvements without notice.

■ <b>Power output</b> <i>(both channels driven)</i>	200W/ch continuous rms @ 8Ω 400W/ch continuous rms @ 4Ω
■ <b>Frequency response</b>	10Hz – 22kHz (+0/-0.1dB) 10Hz – 155kHz (+0/-3.0dB)
■ <b>Phase</b>	better than -10° @ 22kHz
■ <b>Signal-to-noise ratio</b>	108dB <i>(ref. full output, 10Hz – 80kHz)</i>
■ <b>Channel separation</b>	better than 110dB @ 20kHz
■ <b>Noise floor (FFT)</b>	all peaks less than -95dBV <i>(10Hz – 80kHz)</i>
■ <b>Distortion (THD + noise)</b> <i>(unweighted, 1.0Vrms/1kHz input, 10Hz – 500kHz)</i>	0.003% @ 8Ω
■ <b>Voltage gain</b>	29.1dB
■ <b>Sensitivity</b>	1.4Vrms for rated output @ 8Ω
■ <b>Input Impedance</b>	100kΩ
■ <b>Rated power consumption</b> <i>(as per IEC60065 para. 2.3.10)</i>	480W
■ <b>Idle power consumption</b>	166W
■ <b>Mains voltage</b>	specified on rear panel <i>(cannot be changed by dealer or user).</i>
■ <b>Dimensions</b> <i>(not incl. controls or connectors)</i>	Width: 17.5" (445mm) Height: 8.75" (222mm) Depth: 18.5" (470mm)
■ <b>Shipping weight</b>	92lbs (42kg)
■ <b>Net weight</b>	80lbs (36kg)
